Hi team,

It was great meeting you last week in your office.

As discussed, I'd like to share some key scenarios in recent times where having Juspay benefited merchants by helping them manage industry-level changes and adopt new, better experiences faster and more easily.

1) Tokenization:

- Wave 1 in 2022 (saved cards flow)
- Wave 2 in 2024 (guest checkout flow)

Please note, with Juspay merchants can send use the same token for any PG of their choice, unlike other scenarios where tokens are saved exclusively to a particular PG.

2) Native OTP across multiple PGs:

Unlike regular Native OTP flows which are highly restricted for 2-3 PGs and only a few banks/BINs, Juspay enables Native OTP flows across all your PGs with a common UI and enhanced BIN level coverage, ensuring higher success rates and better experiences for card payments

3) Biometric Auth:

Juspay provides enhanced biometric auth flows (Face ID/fingerprint) in a single SDK for multiple banks/UPI apps. The same can be extended across each of your PG partners with Juspay

4) UPI Block and Pay

- Single block, multiple debits
- Single block and release/pay

Single integration with Juspay ensures no changes needed across multiple partners. You can also check all active customer mandates in a single place

5) **UPI collect discontinuation:** Juspay seamlessly managed the different rollout implementations for Collect across Android/iOS checks across multiple PGs. We also manage multiple different timelines to ensure only PGs still supporting UPI collect get the traffic

6) Unified offers engine:

Common velocity checks for different users/cards/BINs etc across multiple different PGs to ensure zero leakage of offers budget

7) Proactively managing PG downtimes:

Using Juspay ecosystem level data, you can pre-empt PG level downtimes and effortlessly switch traffic to your fallback PGs instantly so that there is no impact on transactions.

This is in addition to some features I already mentioned, such as:

- 1) Custom Native checkout experience requiring minimal management effort from Truemeds and customization on showing/hiding payment options etc
- 2) In-app UPI experience without leaving the Truemeds app with highest success rate
- 3) Conversion of COD orders to payment of delivery via dynamic UPI QR
- 4) Managing multiple payment integrations, PGs, wallets etc without any tech/ops load
- 5) Offers via cashback, instant discount, split payments, rewards through various partners

Thanks & Regards,

Akshay Khandelwal
